

Investment Candidate Analysis

KPI rundown, quantitative price screen & listed-peer comparison — Orion Chips, Cleanergy & NovaTerra AI

PREPARED FOR: EDEN QUANT TEAM ALLOCATION UNDER REVIEW: €5,000 CONFIDENTIAL — INTERNAL USE

Scope & basis. The three target companies are fictional; the daily price files supplied are simulated series and are used here strictly as a quantitative exercise, not as a live track record. Operational KPIs are taken from the assessment brief; derived metrics (CAGRs, implied revenue, margin/mix trends) are computed from those figures. Listed-peer figures are drawn from public company filings and press releases and are presented as factual reference points. Returns are annualised at 252 trading days; Sharpe and Sortino use a 0% risk-free baseline for cross-comparability.

1 Quantitative price screen

Daily returns computed over each instrument's full available history. This is the core "quant" read: return, risk, and the shape of each path.

Metric	Orion	Cleanergy	NovaTerra
History (years)	6.7	8.4	13.5
Price path	100 → 2,082	8.0 → 14.9	30.2 → 31.4
CAGR	+57.4%	+7.7%	+0.3%
Annualised volatility	56.6%	46.0%	31.8%
Sharpe (rf = 0)	1.06	0.39	0.17
Sortino (rf = 0)	1.44	0.67	0.28
Max drawdown	-62.8%	-93.0%	-87.5%
Trailing 1-year	+103%	+318%	+0.1%
Trailing 6-month	+76%	+291%	+38%
Trailing 3-month	+32%	+154%	+26%

Pairwise daily-return correlations are effectively zero: Orion–Cleanergy -0.02, Orion–NovaTerra +0.07, Cleanergy–NovaTerra +0.01.

WHAT THE PRICE SHAPES SAY

Orion is the only candidate combining a high return with a respectable risk-adjusted profile (Sharpe ~1.06) and is still trending across 3m/6m/1y — a momentum-plus-quality signal. **Cleanergy** is a deep-cyclical recovery: it survived a -93% drawdown and is +318% over the last year — a high-beta bounce, not steady compounding. **NovaTerra** is effectively dead money: 0.3% CAGR over 13.5 years, below inflation, with an 87% drawdown along the way.

2 Operational KPIs & derived metrics

Orion Chips	Fabless edge-AI inference silicon · Copenhagen
-------------	--

KPI	2022	2025	Derived signal
Chips shipped (M)	0.82	4.15	71.7% CAGR
Average selling price (\$)	38.4	28.9	−9.0% / yr (price erosion)
Gross margin	61%	51%	−10pp (compressing)
Software revenue mix	11%	27%	+16pp
Implied total revenue	~\$35M	~\$164M	~67% CAGR

Tension: volume is exploding but ASP and gross margin both fall — revenue grows because units outrun price, while the margin trend signals commoditisation.

Cleanergy

Grid-scale battery storage + GridOS software · Houston

KPI	2022	2025	Derived signal
GWh under management	0.8	3.9	69.6% CAGR
Annual recurring revenue (\$M)	52	241	66.7% CAGR
ARR per GWh (\$M)	65.0	61.8	roughly flat
Gross margin	38%	47%	+9pp (expanding)
Software subscription mix	18%	39%	+21pp

Best-looking KPI table of the three — fast growth, expanding margin, rising software mix. The 47% gross margin is the figure to interrogate (see §3).

NovaTerra AI

Precision agriculture: satellite + sensors + SaaS · Austin

KPI	2022	2025	Derived signal
Acres monitored (M)	9	31	51.0% CAGR
Revenue per acre (\$)	5.2	4.6	−4.0% / yr
AI prediction accuracy	81%	91%	+10pp
Subscription mix	48%	69%	+21pp
Implied revenue	~\$47M	~\$143M	~45% CAGR

Acres grow fast but revenue per acre is sliding — low-value acres are being added faster than they are monetised. Weaker unit economics than the headline acreage suggests.

3 Listed comparables & read-through

The closest pure-play public peer for each candidate — and the single most useful finding for an EDEN screen.

Candidate	Closest listed peer	Revenue (FY)	Growth	Gross margin	Profitable?
Orion	Ambarella (AMBA) fabless edge-AI SoCs	~\$280M; guide ~\$379M	+31–38%	~60% (non-GAAP)	GAAP loss; non-GAAP only
Cleanergy	Fluence (FLNC) BEES integrator + software	~\$2.3B	+50%+ guided	~13%	Net loss \$68M FY25
NovaTerra		~\$244M	~+33%	~57%	

Candidate	Closest listed peer	Revenue (FY)	Growth	Gross margin	Profitable?
	Planet Labs (PL) satellite ag data (NovaTerra's own supplier)				GAAP loss \$123M; adj. EBITDA+ only

Source: company filings & press releases (FY2025/FY2026 reporting). Profitable large-cap anchors that would pass EDEN's rules: edge-AI → Nvidia, Qualcomm, Marvell, ARM; energy storage → Tesla (energy), Enphase, Generac; precision ag → Deere, AGCO, Trimble.

KEY READ-THROUGH 1 — CLEANERGY'S MARGIN IS THE ANOMALY

The real integrator Cleanergy most resembles (Fluence) runs a ~13% gross margin because the business is hardware-heavy and cell-supply-dependent — which Cleanergy's own profile admits. A claimed 47% gross margin in this sector is the riskiest single number to accept at face value.

KEY READ-THROUGH 2 — ORION IS A WEAKER VERSION OF ITS OWN COMP

Ambarella's filings confirm ASPs fall as products mature — yet Ambarella *holds* ~60% gross margin, while Orion's is already down to 51% and still falling. Orion's margin path looks like a softer version of the closest real benchmark.

KEY READ-THROUGH 3 — THE PROFITABILITY FILTER

All three closest pure-play peers (Ambarella, Fluence, Planet Labs) are currently GAAP-unprofitable. EDEN's rules bar unprofitable stocks — so the truly investable real-world expressions of these themes are the profitable large-caps, several of which the existing portfolio already touches (e.g. ASML for semiconductors).

4 Pros & cons

Orion Chips

PROS

- Best risk-adjusted price profile (Sharpe ~1.06) and strongest fundamental growth (~67% revenue CAGR).
- Rising software mix (11 → 27%) toward recurring revenue.
- Denmark HQ → OECD-market eligible; differentiated on performance-per-watt.
- Rides a genuine edge-AI / automotive secular trend.

CONS

- Gross margin compressing 61 → 51%; ASP falling ~9%/yr (commoditisation).
- Zero manufacturing control — fully dependent on TSMC / Samsung.
- Customer concentration: Bosch 31% + Tesla 22% = 53% in two names.
- Competes with Nvidia / Qualcomm / Marvell on a fraction of their capital; closest comp not GAAP-profitable.

Cleanergy

PROS

- Strongest KPI table — ~67% ARR CAGR with expanding margins and rising software mix (18 → 39%).
- Lease model → recurring, sticky revenue.
- +318% trailing-1y momentum; clear energy-transition tailwind.
- Thematically complements an existing XLU (utilities) holding.

CONS

- -93% historical max drawdown — extreme tail risk.
- 47% gross margin implausible vs. real peers (~13%).
- No cell manufacturing → lithium / cobalt supply exposure.
- Customer concentration: Duke 32% + NextEra 24% = 56%; pure-play peers loss-making.

NovaTerra AI

PROS

- Highest AI-accuracy trajectory (81 → 91%) and highest subscription mix (69%).
- Broader, more diversified supplier base.
- Lowest price volatility of the three (31.8%).
- Real ESG substance (claimed water –11%, fertiliser –8%).

CONS

- Dead money: 0.3% CAGR over 13.5 years, –87.5% drawdown.
- Revenue per acre declining (–4%/yr) — weak unit economics.
- Expansion plan (SE Asia / Sub-Saharan Africa) collides with EDEN's emerging-markets ban.
- Underlying precision-farming market grows only ~6.7%; closest comp (its own supplier) is GAAP-unprofitable.

Prepared as supporting analysis for the EDEN Quant Team Assessment. The three subject companies are fictional and the price series are simulated; figures derived from them are illustrative. Listed-peer data reflect publicly reported figures as of the most recent available filings/press releases and may be restated. This document is analytical work product for an internal recruitment exercise and is not investment advice or a recommendation to transact in any security.
